Start of transcript. Skip to the end.

In the previous lessons, we've been looking at how to affect the appearance of HTML elements using CSS. In this lesson, we'll go back to plain HTML and talk about some of the other tags that are available to us, starting with lists. In HTML, we can create lists of elements or of items that are ordered or unordered. In an ordered list we use the ol tag, for ordered list.

Notes:

- The HTML for the example shown at the end of the lesson is available [here](#). You can right-click the link and save it to your computer so that you can view it locally.
- At 2:13 the instructor mentions "unordered lists" but that should be "ordered lists" in this example.
